

Solar Farm Provider Rolls out New Investor Program

Specializing in Utility Scale Solar Projects both in the U.S. and Abroad.

ASHEVILLE, N.C., Feb. 17, 2015 /PRNewswire/ -- Innovative Solar Systems, LLC has just introduced a cutting edge way that investors of all types can have access to partial ownership in large scale solar farm projects across the nation for as little as \$250,000 per project. This new program offered by ISS will allow individuals or groups to become limited partners in one or more early stage large scale solar farm projects being developed by the company in counties throughout the United States. ISS is currently one of the largest developers of utility scale solar farm projects in the Southern United States and is rapidly expanding throughout the nation. The company's new partnership program allows ISS to develop more projects and thus expand across the nation faster while sharing profits through a partnership basis with investors that desire to be a part of the renewable energy boom.

An investor or financial group would purchase a 1/3 ownership interest in an early stage ISS solar farm project for as little as \$250,000 and then realize a notable profit within 12-18 months when the project is deemed construction ready and then sold and signed over to the long term owner of record that will finance and own the asset after system commissioning. Innovative Solar Systems has become a leader in forward thinking when it comes to renewable energy projects while quickly implementing massive amounts of solar farms on the grid here in the U.S. ISS has a long track record in the solar industry and has developed over 100 commercial and utility scale solar projects to date while currently having approximately fifty (50) new projects totaling over 1GW in various stages of development for the 2015 calendar year.

Innovative Solar Systems, LLC has developed the majority of the largest utility scale solar farm projects to date here in the South East and continues to expand the company's development strategies to mid and Western U.S. Developing these large scale solar farm projects can be more complex than building sky scrapers and ISS appears to be capturing market share of these large solar energy plant projects. For Investor Relations or to learn about any of the current approved and construction ready utility scale solar farms for sale please contact John E. Green of ISS today at (828)-215-9064.
